PREAMBLE

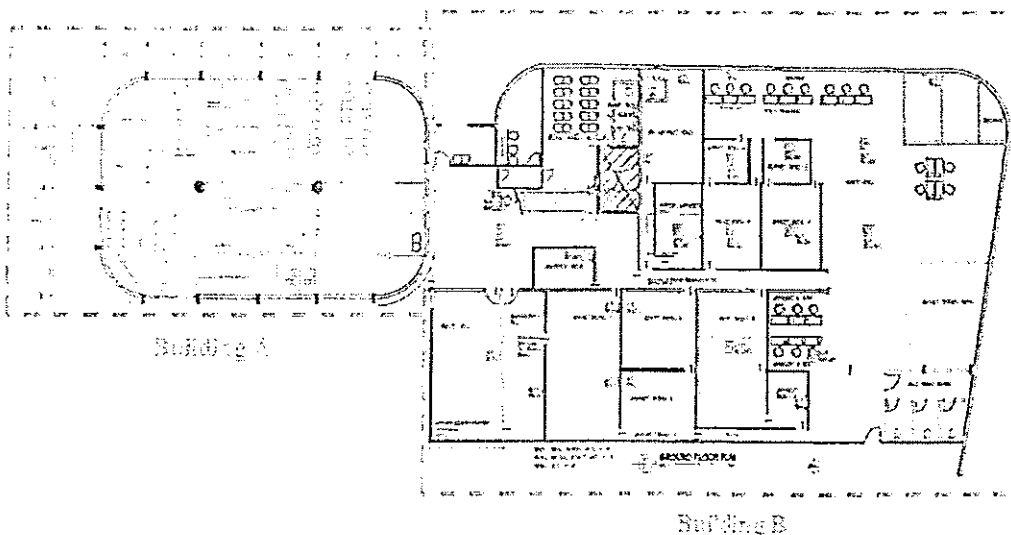

Ministry of National Planning and Infrastructure has mandate over quality control of the various structures either residential, public or private/government offices. In that regard, any reasonably or visually questionable structures either in pre or post construction phase will be investigated by MNPI officials for the safety of both the residents of that particular premise and its neighbors. It is by these regulations that the space occupied by Criminal Court, the old STO building was visually inspected upon their request.

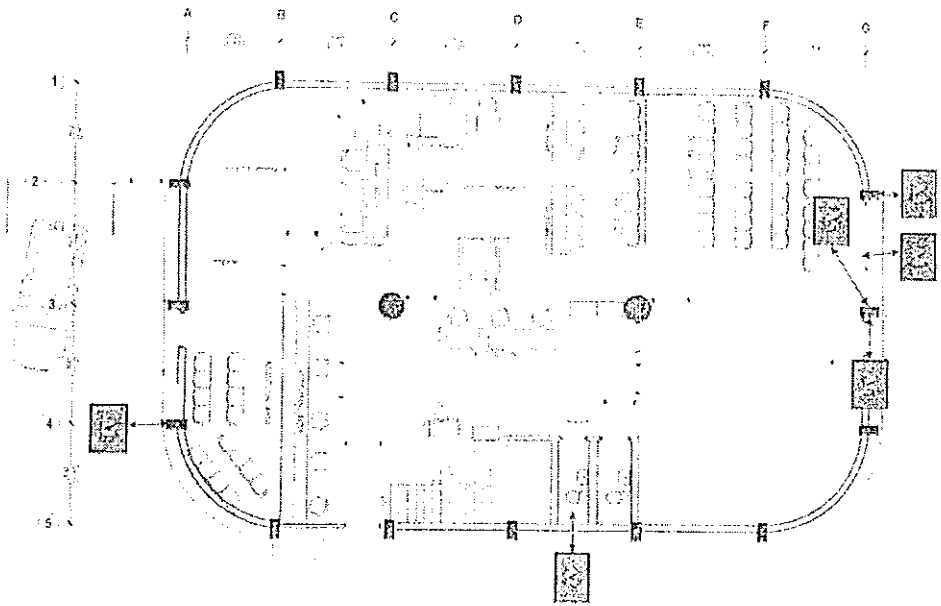

METHODOLOGY

This condition assessment was carried out based on visual inspection only. The columns, beams, interior and exterior walls were investigated, visually recorded on camera and an assessment made based on the conditions of the building at the time of inspection (30th May 2019).

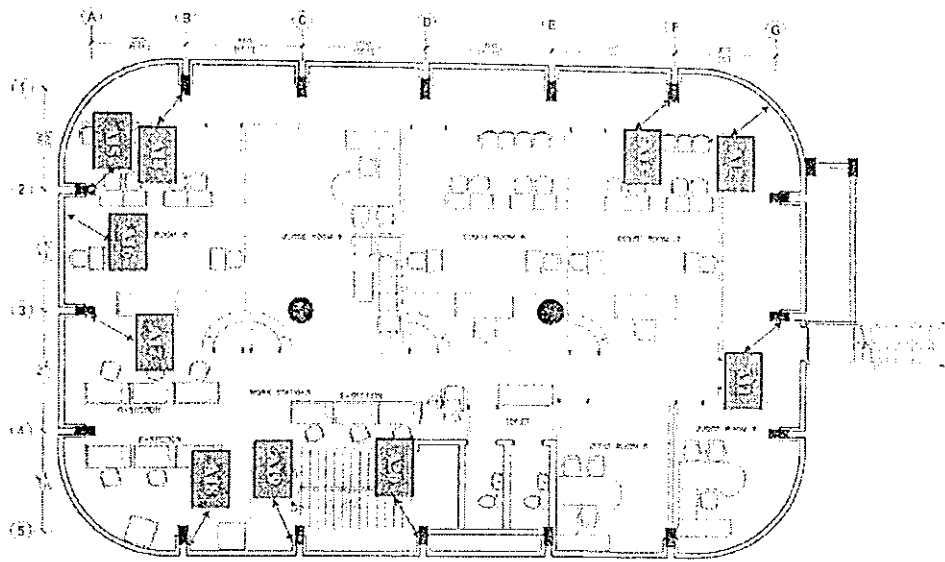

FIELD OBSERVATIONS

The main focus of the visual inspection was to check for structural damages to the building and the points of water leakage and the damages caused by the water to the building interior. Major damages include but not limited to slab failure of the ground floor ceiling as well as multiple cracks on beams and columns concentrated mostly on the ground floor.

GROUND FLOOR

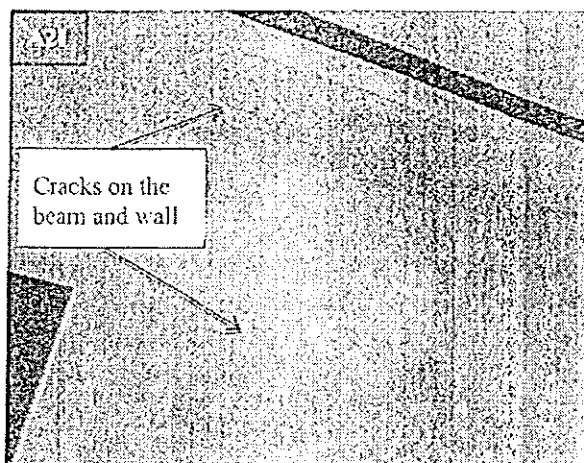

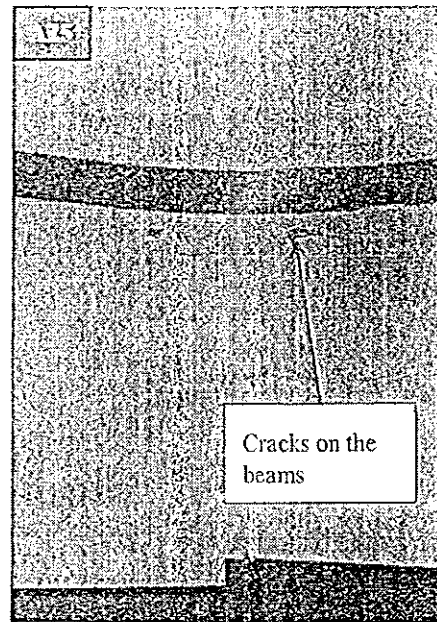

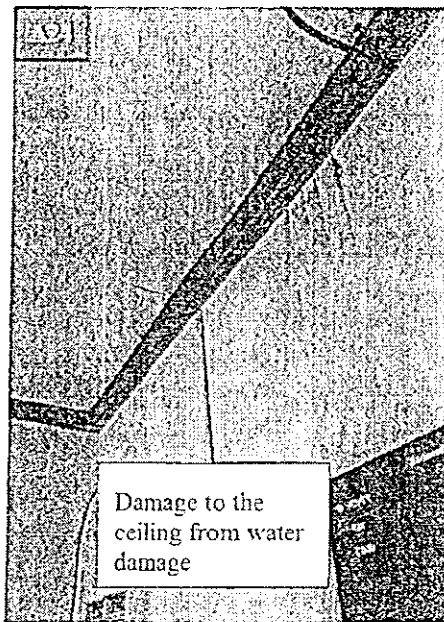

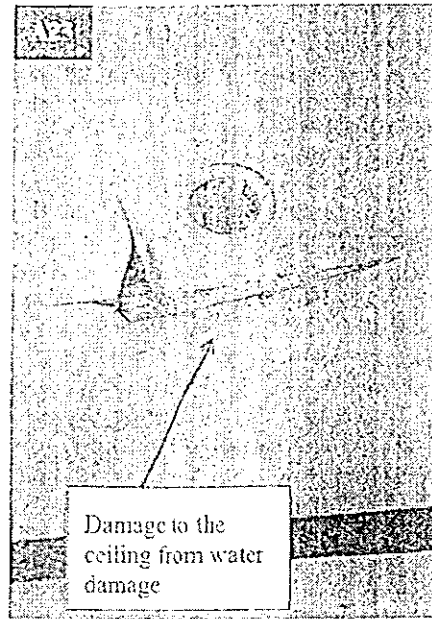

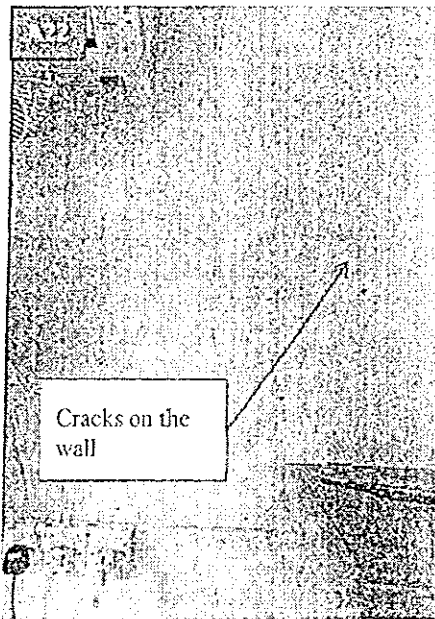

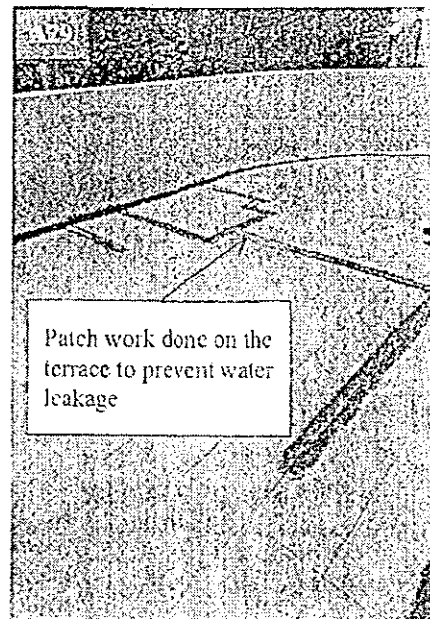

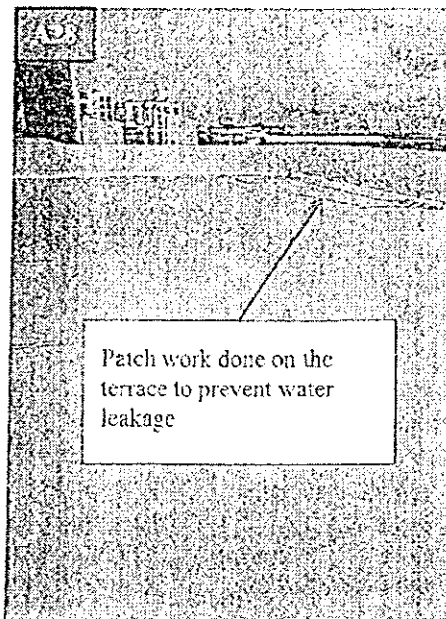

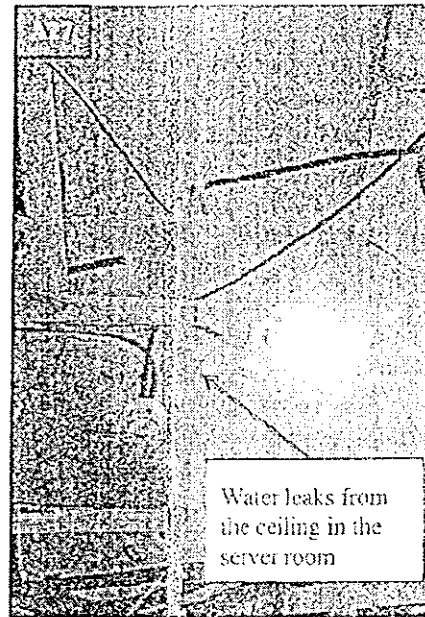

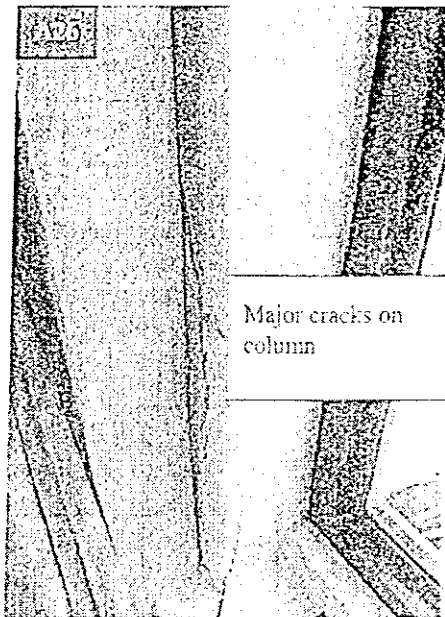

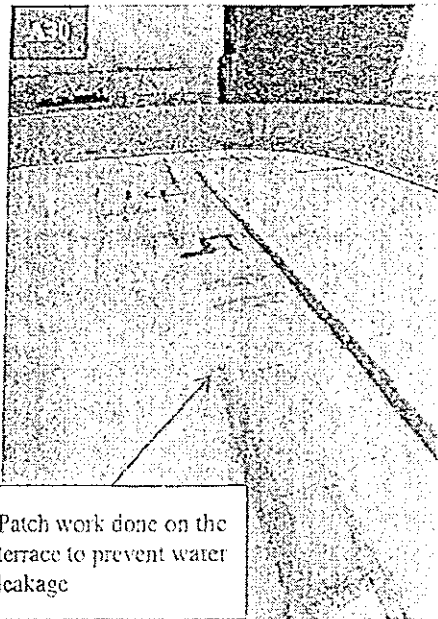

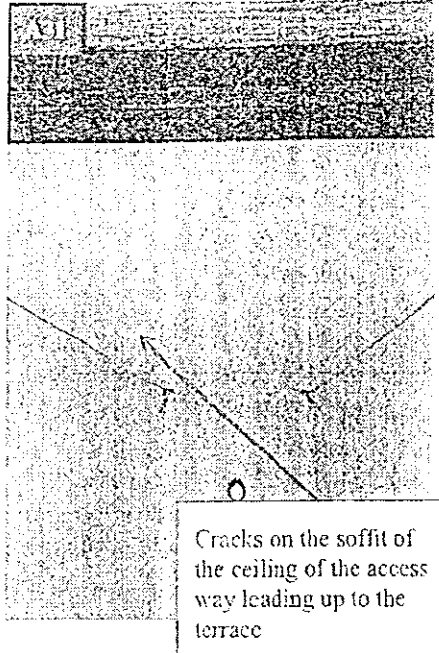

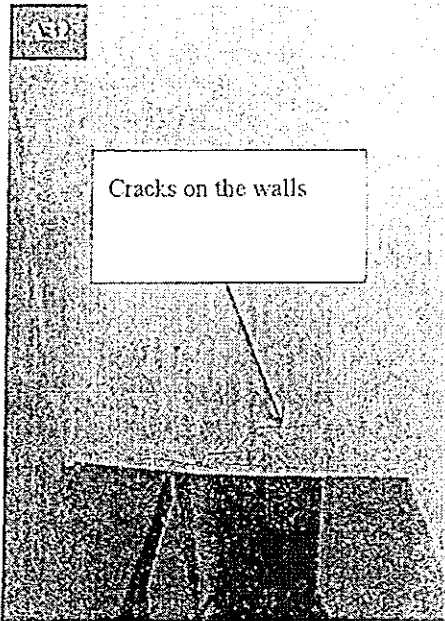

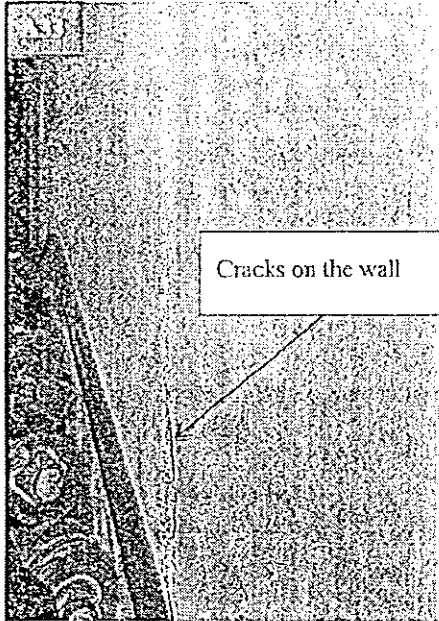

Patch work done on the terrace to prevent water leakage

Cracks on the soffit of the ceiling of the access way leading up to the terrace

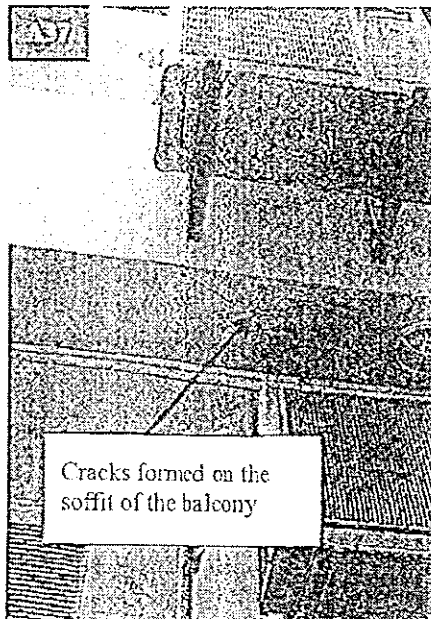

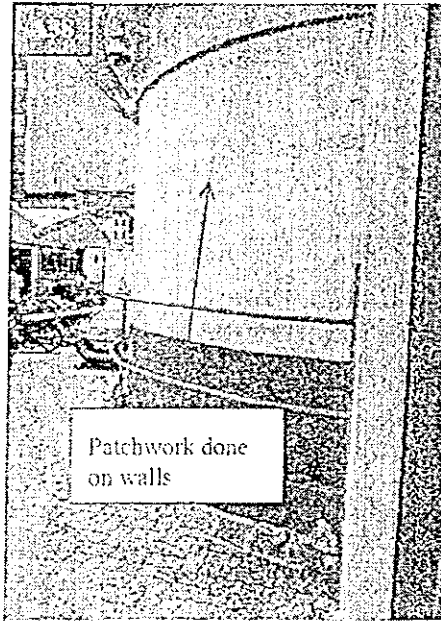

Cracks on the walls

Cracks on the wall

EXTERIOR

OBSERVATIONS

Multiple cracks were observed on the columns beams and walls of the ground floor and first floor (Refer to figures A1 through A20). Some of which were extremely severe most noticeably the slab failure of the ground floor ceiling (Refer to figure A2). The columns in the ground floor had severe vertical cracks (Refer to figures A1, A3, A5 and A6). The balconies on the first floor had severe internal and external cracks (Refer to figures A18, A19 and A20). A part of the exterior walls of the balcony was observed to be broken off (Refer to figure A34).

Signs of water leaks through the walls and the ceiling were observed on the 3rd floor (Refer to figures A23, A24 and A27). According to the staffs and what is discernible from on-site, water leaked excessively into the server room observed in the figure A27 where patchwork was observed to be done previously.

Patchwork was observed in multiple places of the terrace seen in figures A28, A29 and A30. The access to the terrace had several cracks formed on the walls (Refer to figures A31, A32 and A35).

RECOMMENDATIONS

The failure of the slab observed in figure A2 is severe and need to have immediate action taken. It is highly recommended to chip away the damaged and deteriorated parts of the slab, preferably altogether since reinforcement had deteriorated beyond repair, and recast. It is recommended to repair the cracks on the beams and columns by concrete patching methods by use of masonry adhesive or an appropriate type of bonding agent can be applied to the inner surface of the crack, then filling the crack with concrete until it is completely filled and smoothing out the surface to match the texture of the adjacent concrete finish.

Further recommendation is to conduct a structural analysis/assessment of the structure by a third party with use of equipment appropriate for such an assessment.

CONCLUSION

Structural defects or damages that are an immediate concern to the structural integrity of the building and the safety of the occupants were observed and need to be addressed as soon as possible.
